-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 15 September 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 13-17 is/are pending in the application.
- 4a) Of the above claim(s) 16 and 17 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 13-15 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. §§ 119 and 120

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 13) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application) since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.
- a) ☐ The translation of the foreign language provisional application has been received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121 since a specific reference was included in the first sentence of the specification or in an Application Data Sheet. 37 CFR 1.78.

Attachment(s)

- ☒ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____
- ☐ Interview Summary (PTO-413) Paper No(s). _____
- ☐ Notice of Informal Patent Application (PTO-152)
- ☐ Other:

Art Unit: 1753

DETAILED ACTION

Election/Restrictions

Newly submitted claims 16 and 17 are directed to an invention that is independent or distinct from the invention originally claimed for the following reasons: Claims 16 and 17 are directed to a method of *testing* a resistor and not to a method of *making* a resistor.

Since applicant has received an action on the merits for the originally presented invention, this invention has been constructively elected by original presentation for prosecution on the merits. Accordingly, claims 16 and 17 are withdrawn from consideration as being directed to a non-elected invention. See 37 CFR 1.142(b) and MPEP § 821.03.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claim 15 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Specifically, the obtaining the resistivity by dry etching without annealing is not discussed in the specification. The specification does discuss obtaining the resistivity by sputter depositing without annealing.

Art Unit: 1753

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 15 is rejected under 35 U.S.C. 102(b) as being anticipated by Hohenstein "Cermet Resistors by Concurrent rf and dc sputtering", Communications, October 1967, pp. 65-66.

Hohenstein teach a resistive film with a specific resistivity of .0021ohm-cm in Table I. The film can be etched by rf etching with no annealing. (pp. 56)

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to

Art Unit: 1753

consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 13, 14 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Norimitsu (Japan 01-256101) in view of Kaiser et al. (U.S. Pat. 4,591,417), Hohenstein "Cermet Resistors by Concurrent rf and dc sputtering", Communications, October 1967, pp. 65-66 and Jankowski et al. (U.S. Pat. 6,217,722).

Norimitsu teach a resistor 2 composed of tantalum-silicon oxide (***Ta-SiO₂***) with a ***0 to -500 ppm*** in the resistivity range of ***1-100 milliohm-cm***. ***The TCR can almost be equal to zero by performing Ta-SiO₂ sputtering, wherein a target whose SiO₂ mol ratio in the target composition ratio is in a range of 30-70%, and argon gas pressure is kept about $1 \cdot 10^{-2}$ Torr. (i.e. 10 mTorr)*** (See Abstract) From Figure 2 the SiO content versus TCR is the shown. ***From Figure 3 the pressure versus TCR is shown.*** (See Figures 2 and 3)

The differences between Norimitsu and the present claims is co-sputtering is not discussed, is that co-sputtering utilizing DC for the metal target and RF for the insulator target is not discussed, the requirement for power is not discussed, the etching is not discussed, the use of a magnetron is not discussed and the thickness of a resistive film is not discussed.

Kaiser teach that it is well known in the prior art to sputter from a composite target to produce a particular composition resistive film with the disadvantage being that sputtered particle size vary through the film. (Column 1 lines 31-33; Column 2 lines 11-22)

Art Unit: 1753

Kaiser suggest a method to solve the above problem by sputtering from two targets with adjustable power to control the composition of the cermets. (Column 2 lines 25-31)

The metal volume fraction of cermets can be easily changed by changing, for example, relative power applied to the two targets, whereas in the prior art co-sputtering method, the target composition must be changed each time it is desired to change the metal volume fraction. (Column 2 lines 65-68; Column 3 lines 1-2)

Radio frequency power and monitoring circuits 50 and 51 are coupled to targets 40 and 41, respectively, so that the sputtering process can be adjusted, controlled and monitored. (Column 3 lines 64-67) ***The relative amount of material deposited on substrate 39 from each target 40, 41, which determines the composition of the cermet, is precisely controlled by the ratio of the powers supplied to each target 40, 41 by the power and monitoring circuits 50 and 51.*** (Column 4 lines 16-21)

In summary, the metal insulator composition of the cermet is dependent on the relative rates of deposition of the metal and the insulator. (Column 4 lines 32-35)

The choice of the relative power to the Au and silicon dioxide targets determine the metal volume fraction. (Column 5 lines 22-23)

The motivation for controlling the power to targets for sputtering is that it allows for control of deposition rate for control of the composition of the film with control of particle size. (Column 2 lines 65-67; Column 2 lines 11-22)

Hohenstein teach making a thin-film resistor of extremely high resistance by ***dc sputtering*** a metal while concurrently sputtering a ceramic using the ***radio frequency***

Art Unit: 1753

sputtering technique. (Page 65) The method involves pumping the system to a pressure of 5×10^{-7} Torr and backfilling with argon to a pressure of 5×10^{-3} Torr. The argon flow is stabilized at 4.7 cm³/min. The plasma is carried by the anode circuit at 45 V and 3 ½ A. The voltage and current for the metal electrode and the ceramic electrode are varied depending on the electronic characteristics desired in the film and the metal used. For the metal electrode, the voltage range was 400 V to 1200 V; current range was from 70 mA to 250 mA. **For the Pyrex electrode, the rf power output was from 200 to 600 W.** (Page 66) Sheet resistance varied from 7.5 ohm/square to 4 Mohm/square. **Specific resistance varied from 10^{-6} to 2×10^{-1} ohm cm.** The temperature coefficient of resistance varied from about -400 parts per million for a low-resistance film, to about 2000 ppm for the very high resistance films. (Page 66)

One factor influencing resistivity is the power to the ceramic electrode (i.e. silicon dioxide electrode). (page 56)

For etching the cermets, the rf-etching technique can be used. (pp. 56)

The motivation for utilizing combined DC and RF sputtering techniques with control of power is that it allows production of resistive films with a controlled resistance. (Page 66)

Jankowski et al. teach rf sputter depositing from a ceramic target using a reactive working gas mixture of Ar and O₂. The film resistivity can be discretely selected through control of the target composition and the deposition parameters. (See Abstract)

Fig. 3 graphically illustrates resistivity variation with oxygen partial pressure as

Art Unit: 1753

measured at 10 volts for deposition conditions of a 6 mTorr total working gas pressure and a 6 Watts cm^{-2} applied target power. (Column 4 lines 18-21)

A gas pressure ranging from **2 mTorr to 15 mTorr** is typically used to operate the **planar magnetron source**. A substrate is used with an electrically conducting surface, as for example a metal-coated silicon wafer. (Column 4 lines 56-60)

The rf sputter deposition is carried out using an energy in the range of about 2 to about 20 Watts cm^{-2} . (Column 6 lines 35-37)

The thickness of the resistive films can be less than 1 micron thick. (See Abstract)

The motivation for utilizing a magnetron for sputtering is that it allows for deposition of a resistive film with stable behavior. (Column 2 lines 24-26)

Presumably the Rs, TCR and resistivity will be the same as Applicant's claims since the process conditions are taught by the combined references which recognize the significance of power and pressure when sputter depositing resistive films.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Norimitsu by co-sputtering with controlled power to target for compositional film control as taught by Kaiser et al., to have co-sputtered utilizing DC for the metal target and RF for the insulator target within a particular power range and to have etched as taught by Hohenstein et al. and to have utilized a magnetron and particular thickness of a resistive film as taught by Jankowski

Art Unit: 1753

et al. because it allows for deposition of a resistor with controlled resistance and stable behavior.

Response to Arguments

Applicant's arguments with respect to claim 13-15 have been considered but are moot in view of the new ground(s) of rejection. It is believed that the combinations of references cited above teach applicant's claimed invention.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Rodney G. McDonald whose telephone number is 703-308-3807. The examiner can normally be reached on M- Th with Every other Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nam X. Nguyen can be reached on 703-308-3322. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9310.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-0661.
